

SINTEF Technical Approval - Health and Environmental Requirements

1 Background

A SINTEF Technical Approval includes the health and environmental properties of the product in use. The health and environmental assessment is based on the requirements given in TEK 17 – Regulations on technical requirements for building works (Norwegian: Forskrift om tekniske krav til byggverk). The requirements in TEK17 include:

- that products are chosen with no or low content of chemicals hazardous to health or environment (§ 9-2)
- that the amount of waste is reduced and that materials are chosen that can be reused or recycled (§ 9-5)
- that materials give little or no pollution of the indoor air (§ 13-1)
- that products in contact with potable water do not give of substances that reduce the water quality (§ 15-5)

The Product Control Act (Norwegian: Produktkontrolloven), § 3a, requires businesses to consider the substitution of hazardous substances with less harmful substances.

Figure 1 shows an overview of the health and environmental evaluation process. The extent of the evaluation depends on how the product is used in the building. The health and environmental evaluation includes the construction stage, the use stage and the end of life stage.

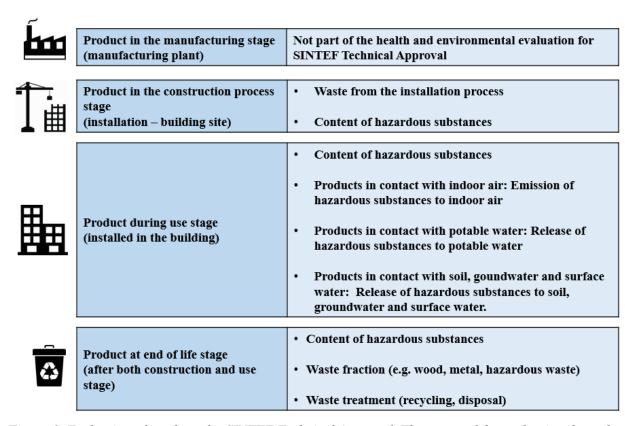

Figure 1. Evaluation of products for SINTEF Technical Approval. The extent of the evaluation depends on the placement in the building.

2 Documentation and limit values

2.1 Documentation that must be submitted for all products regardless of usage

A system may consist of one or several components. The applicant must submit the following documents for all components that are the to be part of the SINTEF Technical Approval:

- A list of all components that are to be part of the approval.
- A short description of where in the building the component is used
- The form "Obtainment of health and environmental data Manufacturer's declaration" shall be filled out. If the system consists of several components, a separate form shall be filled out for each component. The form is filled out by the applicant if they are manufacturing the product, alternatively by the subcontractor if such is used.
- Technical data sheets or other product description of all components that are included in the technical approval
- Safety data sheets (applies only to products that are required to have safety data sheets)
- Products in contact with indoor air: see chapter 2.3
- Products in contact with soil, groundwater or surface water: see chapter 2.4
- Products in contact with potable water: see chapter 2.5
- EPS and XPS: see chapter 2.6

2.2 Content of substances that are dangerous to health or the environment – limits

Allowable content of hazardous substances:

- Manufacturing stage: No requirements
- Construction stage:
 - o chemical mixtures that dries or hardens during the construction stage: see table 1
 - o articles: see table 2
- Use stage and end of life stage:
 - o chemical mixtures that are dry or hardened: see table 2
 - o articles: see table 2

The manufacturing stage, construction stage, use stage and end of life stage are described in figure 1.

Table 1. Concentration limits for the construction stage (product installation). The limits apply only to chemical mixtures that dry or harden during the construction stage. Examples of chemical mixtures: adhesives, sealants, paints, mortars and screeds.

adhesives, sealants, paints, ii

2.3 Requirements for products that impacts the indoor environment

Products that impacts the indoor environment: products that are used inside of the vapour barrier or are part of the vapour barrier/vapour barrier system.

2.3.1 Glued wood based products

Tests of formaldehyde according to EN 717-1, EN 12460-3 (replacing EN 717-2) or EN 12460-5 (replacing EN 120) are accepted for glued wood products, e.g. OSB, particle boards, gluelam and plywood. The testing shall be carried out by an independent test laboratory that has been accredited for the test method. The products must meet formaldehyde emission class E1.

2.3.2 All products exept glued wood products

Testing shall be conducted according to the following standards (testing at 28 days):

- Emissions of volatile organic compounds (VOC) as specified in EN ISO 16000-9 combined with ISO 16000-6
- Emissions of formaldehyde to indoor air as specified in EN ISO 16000-9 combined with ISO 16000-3

Test specimen preparation, calculation of TVOC and the report shall be according to EN 16516. The testing shall be carried out by an independent test laboratory that has been accredited for the test method. The test results must meet the requirements given in table 3.

Products that are certified according to the following classification schemes meet the emission criteria for SINTEF Technical Approvals:

- M1 Emission Class for Building Materials
- GEV Emicode EC1 og EC1 Plus

Table 3. Requirements.

	Limits – very small	Limits – floor/ceieling, wall and
Parameter – 28 days	areas ¹⁾	small areas ²⁾
· ·	$[\mu g/(m^2 h)]$	$\left[\mu g/(m^2 h)\right]$
TVOC	$7100 \mu g/(m^2 h)$	$200 \mu g/(m^2 h)$
Formaldehyde	$700 \mu g/(m^2 h)$	$50 \mu g/(m^2 h)$
Sum carcinogenic	$70 \mu g/(m^2 h)$	$10\mu\mathrm{g/(m^2h)}$

¹⁾ Very small areas are defined in PD CEN/TS16516:2013 as sealants and similar products used in small amounts, i.e. loading factor $0,007 \text{ m}^2/\text{m}^3$.

²⁾ Floor/ceiling, wall and small areas (windows and doors) are defined in CEN/TS16516. These products are used in larger amounts than selants. Windows and doors are small areas.

2.4 Requirements for products that come in contact with soil and water

Products that come into contact with soil and water: products that come into contact with groundwater, surface water or soil - mainly outdoor surface products.

2.4.1 Testing of monolithic products

Monolithic construction products are tested according to CEN/TS 16637-1 and CEN/TS 16637-2. The following parameters are used:

- All leaching steps (64 days)
- Each eluate and the reference is tested for the following:
 - o Concentration of As, Cr, Cu, Ni, Zn, Pb, Cd and Hg
 - o pH
 - o Conductivity
- The final eluate is analysed with respect to organic compounds according to EN 15768. Individual substances must be reported, as well as concentration estimates (toluene equivalents)

The testing shall be carried out by an independent test laboratory that has been accredited for the test method. The test results must meet the requirements given in table 4.

Table 4. Concentration limits, leaching test according to CEN/TS 16637-2.

Parameter	Maxium allowable cumulated emission after 64 days, R_{64} days (= R_8) [mg/m ²]
Arsenic, As	260
Cadmium, Cd	3.8
Chromium, Cr	120
Copper, Cu	98
Mercury, Hg	1.4
Nickel, Ni	81
Lead, Pb	400
Zinc, Zn	800

2.4.2 Testing of granulary material

Granular material is tested according to CEN/TS 16637-3.

2.5 Requirements for products that come into contact with potable water

Products that come into contact with potable water: products used for the supply of potable water that come into direct contact with the water.

2.5.1 Testing of metallic products

Metals which are in contact with potable water, e.g. couplings and taps, shall be tested with respect to leaching of lead and cadmium according to NKB Product Rules.

The testing shall be carried out by an independent test laboratory that has been accredited for the test method.

2.5.2 Testing of plastic products

Plastic products which are in contact with potable water shall be tested using the following standards:

- Factory-made products are tested according to EN 12873-1
- Site-applied products are tested according to EN 12873-2
- Determination of odour and flavour should be conducted according to EN 1420 combined with EN 1622

Products with the following documentation meet the requirements for SINTEF Technical Approval:

- The German KTW-requirements from Umwelt Bundesamt, or similar
- The Dutch guidelines "Regeling materialen en chemicaliën drink- en warm tapwatervoorziening"

The testing shall be carried out by an independent test laboratory that has been accredited for the test method.

2.6 Additional documentation requirements

2.6.1 XPS

XPS (extruded polystyrene) shall be tested as follows:

- Content of Br using XRF or according to EN 14852.
- Content of chlorofluorocarbons and similar substances:
 - o CFC-11, CAS 75-69-4
 - o CFC-12, CAS 75-71-8
 - o HCFC-22, CAS 75-45-6
 - o CFC-113, CAS 76-13-1
 - o HCFC-142b, CAS 75-68-3
- The testing shall be carried out by an independent test laboratory
- Limit values (brominated flame retardants and ozone depleting substances) are shown in chapter 2.2.

2.6.2 EPS

EPS (expanded polystyrene) shall be tested as follows:

- Content of Br using XRF or according to EN 14852.
- The testing shall be carried out by an independent test laboratory
- Limit values (brominated flame retardants) are shown in chapter 2.2.

2.6.3 Other products

After assessment, additional documentation requirements can be made for individual product groups.
